

1. What is blockchain?

Blockchain is a digital ledger that stores information in blocks, linked securely in chain, making data nearly impossible to alter. It is decentralized, meaning no single authority controls it, and all participants share the same copy.

2. Where is blockchain used in finance?

Blockchain is great for finance because it allows secure payments, ~~cross-border~~ cross-border transfers, and smart contracts that automatically execute deals. It should be used where transparency, speed, and trust matter, like banking or remittances.

3. How is blockchain applied outside finance?

Outside finance, blockchain is used for supply chain tracking, health care data management and digital identity verification. For example, it can trace goods from origin to customer, ensuring authenticity and safety.
